

Transportation is a relevant factor shaping our living environment. A distinguishing feature of socially sustainable transportation is that it allows everyone regardless of income, age or disabilities to enjoy the same benefits of mobility. This research will address the question, to what extent the socially sustainable approach is being incorporated in large Polish cities, and what changes can be expected in the future. Different research methods will be used, including spatial analyses, household survey, experts' survey as well as a mobile investigation of travel behaviours using a cell phone app.
